Interface

- An Interface is defined using the interface keyword
- Interfaces are used only during compilation time to check types
- By convention, interface definitions start with an I, e.g.: IPoint
- Interfaces are used in classical object oriented programming as a design tool
- Interfaces don't contain implementations
- They provide definitions only
- When an object implements an interface, it must adhere to the contract defined by the interface
- An interface defines what properties and methods an object must implement
- If an object implements an interface, it must adhere to the contract. If it doesn't the compiler will let us know.
- Interfaces also define custom types

Basic Interface

Below is an example of an Interface that defines two properties and three methods that implementers should provide implementations for:

```
interface IMyInterface {
1
     // some properties
2
     id: number;
3
     name: string;
4
5
     // some methods
6
7
     method(): void;
     methodWithReturnVal():number;
8
     sum(nums: number[]):number;
9
   }
10
```

Using the interface above we can create an object that adheres to the interface:

```
let myObj: IMyInterface = {
1
     id: 2,
2
     name: 'some name',
3
4
     method() { console.log('hello'); },
5
     methodWithReturnVal () { return 2; },
6
     sum(numbers) {
7
       return numbers.reduce( (a,b) => { return a + b } );
8
9
  };
10
```

Notice that we had to provide values to **all** the properties defined by the Interface, and the implementations for **all** the methods defined by the Interface.

And then of course you can use your object methods to perform operations:

```
1 let sum = myObj.sum([1,2,3,4,5]); // -> 15
```

Some Angular Interfaces

Angular uses interfaces all over the place. The interfaces that are used very often are the *LifeCycle Hooks*.

LifeCycle Interfaces

```
export interface OnChanges {
1
     ngOnChanges(changes: {
2
        [key: string]: SimpleChange
3
4
     });
   }
5
6
7
   export interface OnInit {
     ngOnInit();
8
9
   }
10
   export interface OnDestroy {
11
     ngOnDestroy();
12
13
   }
```
